4 WPS – WI-FI PROTECTED SETUP

Simple Config Architectural Overview

This section presents a high-level description of the Simple Config architecture. Much of the material is taken directly from the Simple Config specification.

Figure 1 depicts the major components and their interfaces as defined by Wi-Fi Simple Config Spec. There are three logical components involved: the Registrar, the access point (AP), and the Enrollee.

- The **Enrollee** is a device seeking to join a WLAN domain. Once an Enrollee obtains a valid credential, it becomes a member.
- A **Registrar** is an entity with the authority to issue and revoke domain credentials. A registrar can be integrated into an AP.
- The **AP** can be either a WLAN AP or a wireless router.

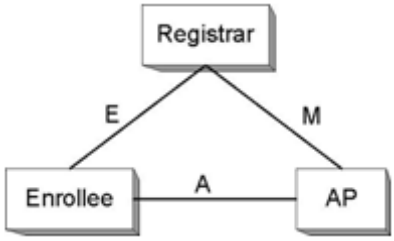

Figure 1. Components and Interfaces

Registration initiation is ordinarily accomplished by a user action such as powering up the Enrollee and, optionally, running a setup wizard on the Registrar (PC).

Notes:

1. When BW=1, PHY_RATE = PHY_RATE * 2
2. When SGI=1, PHY_RATE = PHY_RATE * 10/9
3. The effects of BW and SGI are accumulative.
4. When MCS=0~7(1S, One Tx Stream), STBC option is supported. SGI option is supported. BW option is supported.
5. When MCS=8~15(2S, Two Tx Stream), STBC option is NOT supported. SGI option is supported. BW option is supported.
6. When MCS=32, only SGI option is supported. BW and STBC option are not supported. (BW =1, STBC=0)
7. Other MCS code in HT mode are reserved.
8. When STBC is supported. Only STBC = 1 is allowed. STBC will extend the transmission range but will not increase transmission rate.

iwpriv ra0 set ResetCounter=0       # reset statistic counter
```

5.7.3 Suggestion:

1. To turn on ATE functionality, you have to add compile flag "RALINK_ATE" to Makefile
2. Before doing ATE testing, please stop AP function
3. If you want to test another ATE action, prefer to stop AP & ATE function
4. All ATE function settings will lose efficacy after reboot.
5. Before hardware register access, please reference hardware spec.

Note.

In ATE mode, the channel must set via "ATECHANNEL"

5.8 ated

- ated - user space ATE agent program for RT3572 linux driver, Ralink Tech. Corp.
- RT3572 ATE daemon - ated, comes with RT3572 Linux driver.

The section describes the use of the Linux driver, Windows QA GUI and RT3572 ATE daemon.

5.8.1 Introduction

The ated is an optional user space component for the RT3572 linux driver. AP immediately starts working in ATE mode when "ated" starts (i.e. ATESTART). It behaves as a proxy between Windows QA GUI and RT3572 linux driver when ATE process proceeds.

ATED AUTOMATICALLY STOPS WHEN THE WINDOWS QA GUI IS CLOSED.

Ated can be stopped manually (key in '$killall ated'). The RT3572 linux driver will stop working in ATE mode when ated is stopped or the QA GUI is closed.

5.8.2 Environment setup

1. Connect the platform you want to test directly with a Windows host by ether network line.
2. In the Windows host, run WinPcap_4_0.exe for the QA GUI.

5.8.3 How to use ated for ATE purpose

1. First you should set **both "HAS_ATE=y" and "HAS_28XX_QA=y"** in the file ~/Module/os/linux/**config.mk** and compile the driver.
2. Modify the Makefile according to our target "PLATFORM".
3. Change the path of "CROSS_COMPILE" if needed.
4. Remove "-I$(INCLUDE)" about in line 39 if your target "PLATFORM" is not "PC".
5. Then type 'make' command to compile the source code of the daemon.
6. After the driver interface "ra0" has started up, attach both of "ra0" and the ethernet interface to the bridge interface "br0".
7. Manually start ated, type '$ated -bbrX -iraX'.(For further use of options, type $ated -h)
8. In the Windows host, run RT2870QA_ATE.exe.
9. Select the wired network adapter.
10. Choose 2870_ATE, then press OK.

Note:

The names of WLAN interface(default is "ra0") and Bridge interface(default is "br0") must be specified manually (for example: '$ated –b br1 –ira2') if your WLAN interface or Bridge interface is not "ra0" or "br0" respectively !
